

- Test Assessment-1

1 "Hello World"

Ans- x=(Hello world)

Print x= x[::-1]

2> "A Quick Brown Fox Jump Over the Lazy Dog"

Ans-

str="A Quick Brown Fox Jump Over the Lazy Dog"

count=len(str.split())

print(count)

- 3

. Remove duplicate characters.

>> "Carrot"

4.difference

List	Set
List are Ordered	Sets are Unordered
It is Indexed based	It is Unindexed based
List are used in []	Set are used in {} or set()
In List Duplicates are allowed	In set no duplicate are allowed
It is slower than set	It is Faster than list

5. sets cannot contain lists because sets are immutable or unchangeable.

6. Sets are faster because they use a hash table.

7. difference between remove and discard.

remove() → gives error if item not found and it is unsafe method

discard() → no error if item not found and it is safe.

8. the methods to insert elements in the list is 3 types,

They are - 1.append,2.extend,3.insert.

9. there is 5 methods to delete elements in the list , they are

1. remove

2. pop(n)

3. pop

4. clear

5. del

10. there is 6 Operators in Python these are

1. Assignment Operator - Used to assign values to variables.[=]

2. Arithmetic Operator- it is uses for calculateions [+,-,*,/,//,**,%]

3. Relational Operator/Comparison Operator- it is used to compare values (true/false) [<,>,<=,>=,!=,==]

4. Logical Operator – it is used to combine conditions [AND, OR, NOT]

5. Identity Operator- it checks Address of variables [is , is not]

6. Membership Operator – to check the type [in , not in] , True/False.

11.

12. sort elements in list using slicing method-

> [5,11,14,7,8,3,2,5,9]

list1= [5,11,14,7,8,3,2,5,9]

asc=list1.sort()

des =asc[::-1]

13. Dictionary-A dictionary is a collection of key-value pairs.

14. there is 3 method to create dictionary-

1. Using {}

2. Using dict()

3. empty Dictionary

15. there is 2 methods to access value in dictionary ,these are

1-Using key method

2-Using get method

16. there is 4 methods to delete elements in dictionary-

1. pop(n) # n is the key of dictionary

2. popitems()

3. del()

4. clear()

17. . mathematical operations in sets is 4 type -

1. Union

2. Intersection

3. difference

4. symmetric_difference

18. packing variable in tuple-

- Packing means storing multiple values into a tuple

```
data = (roshan,30," forensic expert")
```

```
print(data)
```

```
print(type(data))
```

19. unpacking-

Extract tuple values into variables.

```
data = (roshan,30," forensic expert")
```

```
print(data)
```

~~Name~~

,age,job = data

print(name)

print(age)

print(job)

20-diff between set and dic

Set

Dictionary

Collection of **unique values**

Collection of **key-value pairs**

{1, 2, 3}

{"a": 1, "b": 2}

Only values

Keys and values

Not allowed

Not allowed

Keys must be unique, values can repeat
